### 0.0.2 Fundamental equations for Binomial MGWR

$$l = \log_b(p/(1-p)) = (\sum \beta_k x_{k,i})$$
 (1)

(2)

where  $x_{k,1}$  is the kth explanatory variable in place i, k are the parameters and p is the probability such that p = P(Y = 1).

```
By exponentiating the log-odds: p/(1-p) = b^{0+1}x_1+2x_2
 It follows from this - the probability that Y = 1 is: p = (b^{0+1}x_1+2x_2)/(b^{0+1}x_1+2x_2+1) = 1/(1+b^{-0+1}x_1+2x_2)
```

### 0.0.3 Example Dataset

### Clearwater data - downloaded from link: https://sgsup.asu.edu/sparc/multiscale-gwr

### 0.0.4 Helper functions

Hardcoded here for simplicity in the notebook workflow

Please note: A separate bw\_func\_b will not be required when changes will be made in the repository

```
fixed=fixed, constant=False,
               spherical=spherical, hat_matrix=False).fit(
                   lite=True, pool=pool)

### Running the function with family = Binomial()

```
In [18]: bw_mgwbr = multi_bw(init=None,coords=coords,y=y_std, X=x_std, n=239, k=x.shape[1], fax
iters = 1
opt_bws = [198.]
```

### Running without family and offset attributes runs the normal MGWR loop

```
In [18]: bw_mgwr = multi_bw(init=None, coords=coords,y=y_std, X=x_std, n=262, k=x.shape[1])
iters = 1
opt_bws = [125.]
```

### 0.0.6 Parameter check

### Difference in parameters from the GWR - Binomial model and MGWR Binomial model

```
In [21]: (bw_mgwbr[3]==gwbr_model.params).all()
Out[21]: True
```

The parameters are identical

## 0.0.7 Bandwidths check

```
In [22]: bw_gwbr
Out[22]: 235.0
In [23]: bw_mgwbr[0]
Out[23]: array([235.])
```

The bandwidth from both models is the same
